Production of acetylene from natural gas (Proizvodstvo atsetilena iz prirodnogo gaza) Kiev, Gostekhizdat USSR, 1963. 176 p. illus., bibliog. 900 copies printed. Managing editor: Raytburd, L. L. (Engineer); Editor of the publishing house: Zelenyuk, Ye. Ye. (Engineer); Technical editor: Berezovsky, V. N.; Proofreader: Yefimenko, N. P.

TOPIC TAGS: acetylene production, natural gas, hydrocarbon pyrolysis, industrial acetylene purification, thermal pyrolysis, electropyrolysis, acetylene concentration

PURPOSE AND COVERAGE: This book is intended for engineers and technicians in the chemical and petroleum-chemical industries and for personnel at scientific-research and design institutes, and may be utilized also by students in the corresponding specialties at vuzes. Numerous literature data on the production of acetylene from natural gas and other hydrocarbon raw materials are generalized. The physical-chemistry and energy bases of the pyrolysis of hydrocarbons to ace-

TITLE: The Dynamics of Oxidation Pyrolysis of Methane in a High-Speed Turbulent Gas Flow

PERIODICAL: Nauchn. zap. L'vovsk. politekhn. in-t, 1957, Nr 62, pp 363 - 372

ABSTRACT: Results are cited of an investigation of the oxidation pyrolysis of CH₄ carried out in a semi-industrial furnace with a capacity of up to 100 nm³/hr of a mixture consisting of 63 - 67% CH₄ and 37 - 33%. In a high-speed turbulent gas flow the reactions of oxidation and C₂H₂ formation are extended over a long path of the flow and proceed parallel to each other, but with a certain advance of the development of burning in the beginning of the reaction channel and a lagging of the oxidation behind the process of C₂H₂ formation in its end. An intensive heat development takes place only in the middle of the length of the reaction channel; in this case the consumption of heat for the formation of C₂H₂ continuous up to 85 - 90% of the length of the reaction channel, attaining 42% of the heat

7-102. OXIDATIVE PYROLYSIS OF METHANE IN A HIGH SPEED GAS STREAM.

Grinenko, B.S., Moscow Acad. Sci. U.S.S.R., 1956, "Chemical Treatment of Petroleum Hydrocarbons (Khimicheskaya Prerabotka Nafty i Uglevodorov),

106-114; abstr. in Ref. Zh. Khim. (Ref. J. Chem. Moscow), 1957, (15),

52235. The experimental pyrolysis/production plant described has a

capacity of 100 cu. m/h of methane-oxygen mixture. The reaction channel

of the furnace is 25/40 mm in diameter and about 600 mm long. The time of

abstion of the gases in the reaction zone is 0.0025-0.005 sec.

The oxygen-methane ratio is 0.6 - 0.65. The concentration of acetylene in the

pyrolysis gas is 8 - 8.6%, which corresponds to a yield of 15 - 15.7% by

volume, or 3% by weight of the original gas. Experiments were carried out with the original mixture preheated to 300 - 350°C, and also without preheating. In the latter case the oxygen consumption rose 4-5%. At the inlet to the reaction channel the distribution of velocities over the cross section was extremely uneven; it was 350 - 500 m/sec on the axis and 3 - 15 at the walls. It was established that the process was stable when the ratio of the maximum velocity to the average velocity over the cross section of the channel was 1.5 to 3.6. Ideas and basic figures are given for the planning of industrial furnaces with multi-jet feed for the mixture and outputs of 2,500

to 10,000 tons of acetylene a year.

TITLE: Sulfonation of petroleum resins

SOURCE: Neftepererabotka i neftekhimiya, no. 10, 1965, 20-23

TOPIC TAGS: petroleum product, sulfonation, resin, ion exchange resin

ABSTRACT: In order to study the mechanism of sulfonation of petroleum resins, a sulfonation of resins obtained from bitumen was carried out. The action of sulfuric acid and oleum gives rise to reactions of sulfonation, sulfone formation, oxidation, and condensation. Oxidation involves the detachment of side alkyl and cycloparaffin substituents with the formation of carboxyl and phenol-hydroxyl groups in the structure of the sulfonated product, and the evolution of carbon dioxide and water of reaction. Oxidative dehydrogenation of six-membered naphthalene rings to aromatic ones and oxidative condensation of the resinous sulfonated product also take place. The sulfonated product has ion-exchange properties and can be used as a cation-exchange material. The optimum conditions for preparing a product with high ion-exchange properties are given. Orig. art. has: 3 figures and 1 table.

Author: Grinenko, N. I. REF ID: A67441
Title: Necessity of Revising the Instructions for Town Surveying (Uzobkhodimo ukorit' izdaniye nauchno-tekhnicheskikh rukovodstv)
Periodical: Godesnaya i kartoografiya, 1958, Nr. 7, pp. 68-73 (part)
Abstract: In 1940 the "Instructions for Town Surveying" were published by the Ministry of Municipal Economy in accordance with the Central Bureau of Surveying and Cartography. In 1946 the "Modifications and Supplements" pertaining to these instructions were published. They are both obsolete at present and do not meet modern requirements which arise in the compilation of building locations 1 : 5 000 and the surveying connected with determinations of the lines and grades of subterranean buildings. It also takes into account neither the buildings of the Gosstroy SSSR (State Building of the USSR) nor aerial photography. In recent years a number of books has been published concerning problems of engineering surveys. They would offer considerable help in working out new instructions for surveying in town and industry areas.

"Effect of Corn Forage Cultivated Together with Soybean on Milk Production in Cattle"

Bucharest, Revista de Ecotecnica si Medicina Veterinara, Vol 16, No. 6, June 1966; pp 42-47

Abstract: [English summary modified] Field experiment with 55 cows reveals that corn with soybeans cultivated together for cattle feed is much more efficient from the standpoint of milk production than is corn alone. In cows producing an average of 14 liters of milk per day, mixed feed increased production up to about 10%. 3 tables, 5 Rumanian references.

CITED SOURCE: Tr. Kuyby*shevsk. aviats. in-t, vy*p. 16, 1963, 229-242

TOPIC TAGS: cermet cylinder sleeve, automobile cylinder sleeve, cermet sleeve

TRANSLATION: A study was made of the wear resistance of Fe-graphite cermet materials in the form of test samples and sleeves of automobile engines (C_{comb} 0.1-0.8% and C_{total} 0.1-1.12%), alloyed with Cu and P additives. Fe powders produced in an eddy mill were used. The metal base had a pearlite-ferrite microstructure with inclusions of free graphite. H_B was 42-112 kg/mm². The alloy containing 0.8% Cu and 0.3% P had a better wear resistance, which was 2.2 times greater than that of the alloyed Ti-Ou cast iron usually employed. Cast iron piston rings paired with the alloy wore 2.3 to 2.45 times less than when with cast iron. A technological process was worked out for producing composite porous cermet sleeves from the selected alloy, and also a technique for installing them in the cylinder block of

Conference on Problems of Automobile Engine Life

117-3-26/20

In the report "The Problem of Choosing Antifriction Alloys for Automobile Bearings", Candidate of Technical Sciences N.M. Rudnitskiy (of NAMI) spoke of a new, USSR made, anti-friction alloy "COC6-6" consisting of 88% lead, 6% antimony, and 6% tin, which is used by 4 plants making automobile bearings. At the Moscow Automobile Plant imeni Likhachev, this alloy brought about an annual saving of 21 million rubles.

It can be used for the new heavy-duty 3-layer bearings. Engineer B.M. Grindorf (Middle-Asian Polytechnic Institute) delivered the report "Increasing the Wear Resistance of Engine Cylinders by the Use of Metal-Ceramic Linings". Engineer D.I. Bran (NIITAvtoprom) reported on increasing the life of valves by aluminizing the facets.

Engineer V.S. Zavel'skiy (NAMI) pointed out in his report "Corrosion Sensitivity of Cast Iron to Sulphur Oxides" that the corrosion of engines has become acute on account of the highly sulphurous fuels used at the present time. He described the tests carried out at NAMI, in which the cylinder-and-piston units were run in sulphurous gas, and the wear was measured by the method of radioactive isotopes. It was concluded that the sulphurous anhydride forming at the burning process can produce gas corrosion at high temperature, which

TOPICAL: Mashinostroitel', 1958, # 3, p 47 (USSR)

ABSTRACT:

The conference was organized by the NTO Mashprom and convened in 1957 in Moscow. A number of 230 delegates from automobile plants, research institutes, and higher technical schools participated.

The following persons delivered reports: Deputy Chief Designer of the Yaroslav Automobile Plant P.I. Novikov, leading designer of the Khar'kov Plant "Serp i Molot", M.K. Kubata, leading designer of the Moscow Plant of Small Engine Displacement Automobiles (Moskovskiy zavod malolitrazhnykh avtomobiley), V.A. Mitrofanov, Candidate of Technical Sciences A.D. Kuritsina of the Machine Institute of the USSR Academy of Sciences (Institut mashinovedeniya Akademii nauk SSSR), scientific worker of NAMI A.G. Al'perovich ("Life of Modern Engines of Soviet and Foreign Make"), Candidate of Technical Sciences M.S. Kornev (of NAMI) ("On Application of Highly Effective Air Filters for Increasing the Life of Automobile Engines").

TITLE: Solution to the problem of isomorphism for a class of semi-groups

SOURCE: Sibirskiy matematicheskiy zhurnal, v. 5, no. 4, 1964, 788-792

TOPIC TAGS: isomorphism, group theory

Abstract: The general problem of isomorphism for semi-groups consists of obtaining an algorithm which constitutes a criterion of isomorphism for any given pair of semi-groups. The impossibility of obtaining an algorithm for solving the problem of isomorphism for semi-groups was first proved by A.A. Markov. It is known, however, that for certain classes of semi-groups the problem of isomorphism is amenable to solution. These include free semi-groups and free and Abelian groups. Furthermore, V.A. Yemelichev solved the problem involving the isomorphism of commutative semi-groups with a single defining relation.

The author obtains an algorithm for solving the problem of isomorphism of semi-groups of a class each of whose semi-groups is finitely defined, satisfying the following condition:

of this potential was noted in that stage of P, when the AC of the running waves was completely blocked in the focus. During that period with optimal strength of excitation, the SNP could spread through the nerve in the form of monophasic potential at the rate of 9 - 10 m./sec. With an increase in the strength of stimulation, it was blocked in the focus proper. In the process of the re-establishment of the function of conduction in the changed segment of the nerve, the SNP decreased parallel with the increase in amplitude of the running wave. -- F. I. Mamladze

of P, there were changes in the form of potential behind the P segment. 26 minutes from the beginning of P development at the lowest limit of the P focus before the AC there appeared a slow negative potential (SNP), which reached 150μ . The AC decreased greatly in amplitude. In the distal segments of the nerve a monophasic potential was recorded. An increase in SNP with an increase in P was observed simultaneously with decrease in AC amplitude, and its reduced rate of propagation. Such a correlation of the excitability waves and of the stationary focal excitation indicates that the amplitude decrease in AC is not due to its extinction in the process of overcoming the resistance of the focus, but is a result of an active reinforcement process of the stationary excitation; a particularly noticeable increase in amplitude

Title : The Slow Negative Potential Outside the Parabiotic
Focus in the Nerve

Orig Pub : Fiziol. zh. SSSR, 1957, 43, No 7, 673-680

Abstract : Parabiosis (P) was produced by an isotonic solution
(0.7%) in the segments of a frog nerve 10 - 20 mm. in
length. The lead-off electrodes were placed on the nerve
in several distances from the P focus; the lead-off was
bipolar. The stimulation was done by an induction coil.
The electrodes were placed in the proximal segment of the
nerve. The action current (AC) of a normal nerve had a
diphasic form. Within 5 - 10 minutes after the development

rhythm appeared also under the influence of proprioceptive impulses, arising in hand movements, which is considered by the authors as an increase in the skin tonus under the influence of the afferent stimuli. The increase of the functional burden deepened the inhibitory process which expressed itself in an increase of the appearance of Δ waves. The "EMG" investigations showed foci of depressed irritation, arising and gradually increasing in the process of the development of the conditioned motor reactions, and expressing itself mainly in the pathologically prolonged impulsation. In the course of treatment, the clinical symptoms usually disappeared earlier than the change in the character of the disturbances in electrical activity and appearances of depression in the motor analyzer. Physiological investigations with burdens in this case exposed clinically hidden pathological states of the brain.

Title : Some Peculiarities of the Dynamics of Cortical Disturbances After a Light Closed Skull Trauma.

Orig Pub : Vopr. neyrokhirurgii, 1957, No 1, 22-25

Abstract : In the majority of patients we observed a weakness of differentiation inhibition and a lowering of basic cortical processes (verbal-motor method). EEG at rest was either normal or its changes were limited to a certain irregularity of the alpha-rhythm and by the presence of separate diffused delta-waves and epileptoid impulses. The depression of alpha-rhythm towards light was weakened or was entirely absent. In some patients during the first days after trauma, light stimuli produced a paradoxical increase in alpha-rhythm (particularly in parietal regions) or its appearance, after previous absence. Alpha-

topological space X satisfies condition S_a' if and only if every subset M of X contains a dense subset of cardinal number $\leq a$. 2. If X is a locally compact space satisfying both conditions S_a and S_a' , then every monotone transfinite sequence $(B_\alpha)_{\alpha<\omega_1}$ of sets B_α which are simultaneously R_β 's and G_β 's is stationary. 3. The Cartesian product of an $[a, b]$ -compact space and a (bi-) compact space is $[a, b]$ -compact. (Here a need not be regular.) 4. The Cartesian product of a space satisfying condition S_a (S_a') and a space having an open basis of cardinal number $\leq a$ again satisfies condition S_a (S_a'). 5. Let Q be the real numbers topologized so that a generic neighborhood of $x \in Q$ is the set $\{y | |x-y| < \delta, |y| > 1\}$ for all $\delta > 0$. Then Q is hereditarily D_{\aleph_1} -compact, satisfies conditions S_X and S'_X , and has the property that $Q \times Q$ is not $[N_1 \times 1]$ -compact and does not satisfy either condition S_X or S'_X . The equivalence of conditions S_X and S'_X is considered. It is shown that these two conditions are equivalent for ordered topological spaces if and only if the Suslin problem has an affirmative solution, and thus the question is both left unanswered and regarded as very difficult.

Grindel, Ion

Grindel, Ion. Géométrie du groupe des affinités qui laisse invariant la forme différentielle extérieure canonique. II. Théorie des hypersurfaces. Acad. Repub. Pop. Române, Ed. ști. Stud. Cerc. Sti. Ser. I, 5, no. 3-4, 85-97 (1954). (Romanian, Russian and French summaries)

A hypersurface V_1 is given in the form

$$x_1 = f(x_1, x_2, x_3) = v_0 + v_1 + iv_2 + \dots + \frac{v_n}{n!} + \dots$$

$$v_0 = 1/v_0, \quad v_1 = A_{10}x_1 + A_{01}x_2 + A_{00}x_3 + \dots$$

1 - 7/7

This V_1 is supposed to leave invariant the exterior differential form $[dx_1 dx_2] + [dx_2 dx_3]$. The equation of the V_1 can then be cast into the form

$$x_1 = i(x_1^2 + 2mx_1x_2)$$

$$\begin{aligned} &+ \frac{1}{3!}(x_1^4 + \alpha x_1^3 + \beta x_1^2 + 3x_2^2 x_3 + 3\alpha x_1^2 x_3 + 3\alpha x_1^2 x_3 \\ &+ 3\alpha x_1 x_2^2 + 3\alpha x_1 x_2^2 + 3\alpha x_1 x_2^2) + \frac{1}{4!}v_4 + \dots \end{aligned}$$

where $m, \alpha, \beta, \dots, v$ are fundamental invariants. The complete set of these invariants with the integrability relations is derived, after which it is found that the hypersurface given by

247-252

ABSTRACT : Experiments involving the treatment of wool with
 $K_2Cr_2O_7$ solutions with the subsequent investi-
gation of chrome treated samples (solubilities in
bases and acids, concentration of available nitro-
gen, dynamometrical tests) established that the
most promising results may be attained with the
use of 1.5% $K_2Cr_2O_7$ basis the weight of wool.

A subsequent treatment in neutral media restores the initial bondages, that is being proved by the observed changes in the fiber length when treated with phenol. The results of this investigation indicates ways of improving dye stability with regard to wet treatments. -- A.Matetskiy.

TITLE : Investigation of the Wool Dyeing Mechanism While Employing Acid Dyes that Produce Uneven Dyeing.
ORIG. PUB. : Bulg. Inst. politehn. Iasi, 1957, 3, No 3-4, 121-134

ABSTRACT : Acid dyes (D) attach themselves to wool by the electrovalent bonds in accordance with the Poray-Koshits positions, as well as in the case of uneven dyeing, in accordance with the Van der Vaal's forces. When dyeing is conducted in neutral media, these additional forces hinder the diffusion of D into the interior of fibers and at an extended processing, lead to the distribution of D on the external zones of fibers only, that may be detected on the cross-sectional profiles of fibers
